

Chapter 13: Passivity, Local Cooling, and Negative Energy Density

This section is already in the book plan, but it has not been written fully yet. The book owner can press Generate section to write this part with the language model connected to TheoryTrace.

Section plan:

Explains passivity and why the global ground state cannot yield work through global cyclic operations, while local conditional operations can create regions of negative energy density. The chapter relates QET to quantum inequalities and energy conditions.
